EDUCATION

University of California – Berkeley

Bachelor of Arts in Data Science

Berkeley, CA

Expected May 2026

Relevant Courses: Data Structures & Algorithms, Principles & Techniques of Data Science, Concepts of Probability, Data Engineering, Data Mining, Machine Learning & Data Analytics

TECHNICAL SKILLS

Machine Learning: Scikit-learn, PyTorch, TensorFlow

Data Science: Pandas, NumPy, Matplotlib, Seaborn

Programming Languages: Python, SQL, R, Java, C/C++, TypeScript

Web Technologies: HTML/CSS, React.js, Flask

Tools: Git, Snowflake, Sigma, Google Analytics, VS Code

EXPERIENCE

Data Scientist Intern – San Francisco, CA

Jun. 2025 – Aug. 2025

DoorDash

- Built and deployed an ML model end-to-end, from feature engineering across multiple operational datasets to a production UI used by ops teams, automating **90%** of manual data collection workflows.
- Collaborated with product and operations teams to define model requirements, success metrics, and rollout criteria; documented findings to keep stakeholders aligned across review cycles.
- Designed and executed A/B tests in Sigma to evaluate model performance and validate operational impact across production workflows.
- Wrote SQL queries to extract and clean large-scale datasets; used Python for feature engineering and exploratory analysis throughout the model development lifecycle.

Data Analyst Intern – Berkeley, CA

Sep. 2024 – Dec. 2024

U4U Teen – Berkeley SkyDeck Pad-13 Accelerator

- Analyzed user sign-up rates, task completion, and retention metrics using Python, Pandas, and Matplotlib; summarized findings in weekly reports shared with the founding team.
- Built data visualizations to surface user engagement trends and presented them to investors and stakeholders during funding discussions.
- Developed an impact report using Google Analytics and Python that tracked key behavioral metrics and helped the team assess readiness for public launch.

PROJECTS

Dimension Estimation Tool | Python, OpenCV, PyTorch, Hugging Face, OpenAI API

May 2025

- Built a hybrid AI-CV pipeline to estimate food portion volume from images, combining depth estimation (DPT), object detection (DETR), and structured visual reasoning via GPT-4o Vision.
- Engineered dimensional ($W \times H \times L$) analysis using PCA and bounding boxes, with fallback logic to reference-object scaling to handle edge cases and model uncertainty.
- Achieved average estimation accuracy within **15%** of ground truth volumes; produced real-time visualizations of depth maps, segmentations, and annotated outputs using Matplotlib and OpenCV.

UC Berkeley Chinese Student Association Website | React, TypeScript, Node.js, GitHub

Aug. 2025 – Present

- Built a responsive web application serving **1,600+** members with event listings, cultural resources, and a team directory using React and TypeScript.
- Implemented an admin dashboard with a content management system, reducing event posting time by **75%** and enabling real-time content updates.

Lung Cancer Risk Factor Analysis | Python, Pandas, Scikit-learn, Matplotlib, Seaborn, Flask

May 2024

- Preprocessed clinical data from **300+** patients — handling missing values and encoding categorical features — to prepare a clean, model-ready dataset.
- Achieved **96%** classification accuracy using logistic regression, validated through cross-validation; designed heatmaps and risk distribution visualizations to support feature selection.
- Deployed findings as a Flask web application demonstrating ML model inference in a healthcare context.
